

# Observability is easier with Elastic in the cloud

Take advantage of end-to-end visibility across your applications and infrastructure to correlate events and innovate faster to address organizational challenges.

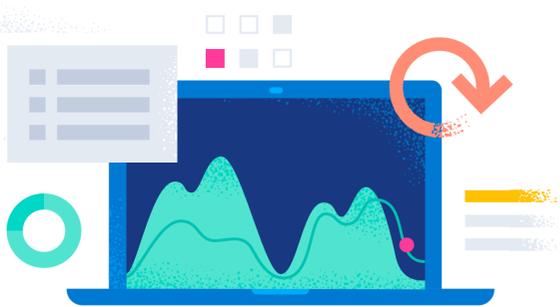

## Autoscale to meet demand

Handle spikes in application and infrastructure data with automatic scaling as your needs expand. Free your teams up so they can spend time on strategic projects rather than tedious maintenance tasks.

## Choose to never delete data again

Collect all your telemetry data from any source. Store data longer, analyze and compare performance over time, and reduce costs with low-cost object storage.

## Leverage data gravity and replication

Search data across clusters in different regions or clouds. Address problems quickly from anywhere and reduce latency for users by keeping data close to them while adhering to data sovereignty requirements.

Help your teams by simplifying management so you can innovate faster, release more frequently, and constantly improve your users' experience. Reduce MTTD/MTTR and always have the historical data you need for root cause analysis.

**Elastic helps the world's leading organizations accelerate results that matter by putting data to work with the power of search.**
