

Search. Observe. Protect.

Unlocking real-time insights for law enforcement

US law enforcement agencies encounter data challenges every single day. It happens when an investigator sifts through file after file, looking for connections to crack a case. It happens when agencies and contractors need to make real-time decisions about where and how to move prisoners. And it happens when border patrol agents need to assess massive amounts of cargo data points and identify which items pose an immediate threat.

Elastic turns those data challenges into opportunities. With search-powered solutions that transform oceans of data into real-time insights, Elastic helps US law enforcement create a modern, data-driven environment that ensures faster responses and more effective long-term strategies to achieve key outcomes:

- Quickly assisting in arrest, interdiction, and crime prevention
- Safeguarding borders with real-time monitoring and alerting
- Securely, safely, and effectively managing prisoners and detainees
- Predicting future opioid outbreaks and identifying fraudulent activity
- Sharing data across agencies to empower task forces
- Combatting advanced security threats and investigating network and systems breaches

Harness the power of search

Elastic is a search-powered platform that can ingest, search, and analyze multiple data types and formats. With a huge capacity for data ingestion and the ability to scale as data needs grow, Elastic empowers agencies to manage petabytes of data efficiently and to return query results in seconds instead of minutes or even hours. And because data can be accessed and analyzed wherever it resides, agencies can start eliminating data silos without ripping and replacing costly legacy systems. The time to value is almost immediate, so analysts and frontline personnel can start getting immediate answers at the time and point of need without a lengthy procurement or setup period.

Optimize your IT investment

Elastic delivers powerful enterprise search, observability, and security solutions built on a single technology stack. Your investment in a single solution yields infinite value as single points of data can be searched and shared to yield insights across multiple use cases.

Elastic Enterprise Search

Elastic Enterprise Search enables workers to sift through relevant information quickly in order to find the intel they need to get the job done faster. By unifying content platforms into a personalized, natural search experience, Elastic Workplace Search makes content findable, fast. In office and remote workers alike can get to the documents and resources they need right away to boost productivity and remove barriers to success.

Elastic Observability

Elastic Observability delivers a unified view of operational data that identifies bottlenecks and unlocks application performance for all users, whether in office or in the field. This same data correlates to greater security, as tracking the behavior of network traffic and processes can alert security teams to anomalies as they crop up. By monitoring events throughout a networked environment, obstacles to performance shrink and access to answers accelerates.

Elastic Security

Elastic Security provides an interactive workspace for analysts to triage events, perform initial investigations, and centralize data across any environment. The Elastic Agent combines prevention, detection, and response into a single autonomous agent. Protecting sensitive data — from case-related details to personally identifiable information (PII) of agency or department personnel, prisoners, and detainees — takes a never-ending effort to identify, stop, and resolve cyber threats and breaches. With Zero Trust as a foundation, Elastic Security enables access to information based on need, user attributes, and clearance levels.

Fuel faster reactions

Elastic empowers agents, analysts, and leadership to quickly uncover patterns, fuel faster reactions, and identify long-term impacts across a number of scenarios:

- **Prisoner care and management.** To power real-time decision-making on safe and efficient prisoner care and transport, information from across agencies and contractors is essential. Medical concerns, special circumstances, and location data all play a role in ensuring that detainees and prisoners are treated securely and humanely. With Elastic, complete information is available in seconds to field agents and on-site personnel.
- **Threat identification and response.** Staying ahead of threats to people, assets, and critical infrastructure depends on continual updates and cross-agency collaboration. Elastic indexes data as it is captured, enabling real-time monitoring and alerts to inform rapid decision making, while removing barriers to information sharing.
- **Border and supply chain risk mitigation.** Ensuring that goods and people coming into the US won't endanger the nation means looking beyond a single port of entry. Elastic enables agents to identify individuals, associations, or relationships that may pose a potential risk, power interdiction efforts, and target cargo that may present a threat.
- **Apprehension and crime prevention.** Both emergent and ongoing needs, such as fugitive tracking and crime pattern analysis, rely on comprehensive information. Elastic search results can incorporate crime statistics and demographic data while overlaying geospatial and other essential information. At the same time, cross-agency collaboration is simplified through Elastic Cloud.
